Computer Fundamentals And Operating System Concepts

Operating Systems and Computer Fundamentals

☐ Module introduction

- >CCAT point of view:
 - Operating Systems: 5 Questions
 - Computer Fundamentals : 5 Questions
- ➤ Reference Book:
 - Operating System Concepts Galvin

Operating Systems and Computer Fundamentals

- ➤ Practice Exam:
 - Quiz : 4 quiz exam **OS** (**10** Question)
 - Quiz : 1 quiz exam Computer Fundamentals (10 Question)
 - Module End Quiz Exam (20 Question)

> Introduction: -

- O Why there is need of an OS?
- What is an OS?
- Booting process in brief
- Functions of an OS

Computer Fundamentals:

- o Major Components : Processor, Memory Devices & IO Devices.
- Memory Technologies and its characteristics
- o IO Techniques

>UNIX System Architecture Design

- o Major subsystem of an UNIX system: File subsystem & Process Control subsystem.
- System Calls & its categories
- Dual Mode Operation

>Process Management

- O What is Process & PCB?
- States of the process
- o Process life cycle
- o CPU scheduling & CPU scheduling algorithms
- o Inter Process Communication: Shared Memory Model & Message Passing Model
- Processor architecture (CF)

>Process Management

- Process Synchronization/Co-ordination
- Deadlocks & deadlock handling methods

≻Memory Management

- Memory types (CF)
- Swapping
- Memory Allocation Methods
- o Internal Fragmentation & External Fragmentation Segmentation
- o Paging
- Virtual Memory Management

≻File Management

- What is file?
- What is file system & file system structure?
- Disk structure (CF)
- Disk space allocation methods
- Disk scheduling algorithms
- Computer structure (CF)
- o Interrupts (CF)
- Direct Memory Access (CF)
- o Input-Output (CF)
- System calls

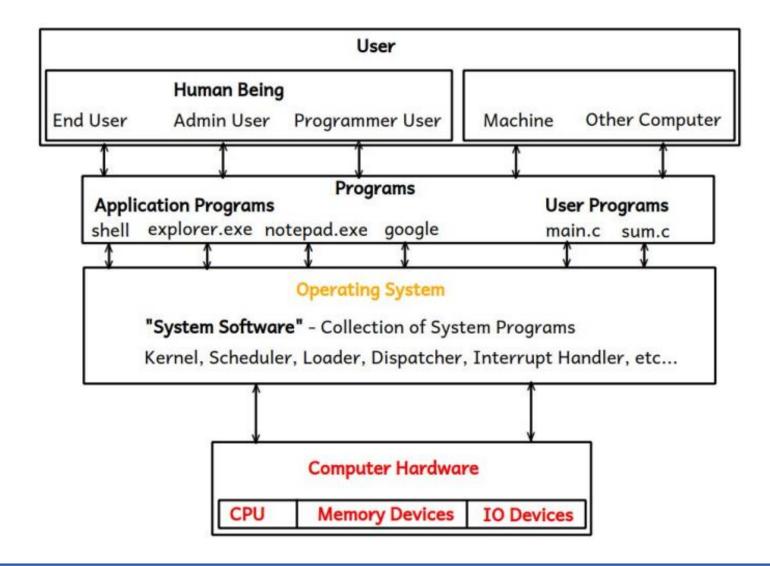

Q. Why there is a need of an OS?

- Computer is a machine/hardware does different tasks efficiently & accurately.
- Basic functions of computer :
 - 1. Data Storage : Memory Devices
 - 2. Data Processing: CPU/Processor
 - 3. Data Movement : I/O Devices
 - 4. Control
 - As any user cannot communicates/interacts directly with computer hardware to do different tasks, and hence there is need of some interface between user and hardware.

Diagram: OS

Q. What is an Operating System?

- An OS is a **system softwar**e (i.e. collection of system programs) which acts as an interface between user and hardware.
- o An OS also acts as an interface between programs and hardware.
- o An OS allocates resources like main memory, CPU time, i/o devices access etc... to all running programs, hence it is also called as a resource allocator.
- o An OS controls an execution of all programs and it also controls hardware devices which are connected to the computer system and hence it is also called as a control program.

• An OS manages limited available resources among all running programs, hence it is also called as a **resource manager**.

□ From End User: An OS is a software (i.e. collection of programs) comes either in CD/DVD, has following main components:

- 1. **Kernel**: It is a core program/part of an OS which runs continuously into the main memory does basic minimal functionalities of it. e.g. Linux: vmlinuz, Windows: ntoskrnl.exe
- 2. Utility Software's: e.g. disk manager, windows firewall, anti-virus software etc...
- 3. Application Software's: e.g. Google chrome, shell, notepad, MS office etc...

Q. What is a Software?

Software is a collection of programs.

Q. What is a Program?

o Program is a finite set of instructions written in any programming language (either low level or high level programming language) given to the machine to do specific task.

***** 3 types of programs are there:

- 1. "user programs": programs defined by the programmer user/developers e.g. main.c, hello.java, addition.cpp etc....
- 2. "application programs": programs which comes with an OS/can be installed later e.g. MS Office, Notepad, Compiler, IDE's, Google Chrome, Mozilla Firefox, Calculator, Games etc....
- 3. "System Programs": programs which are inbuilt in an OS/part of an OS. e.g. Kernel, Loader, Scheduler, Memory Manager etc...

> Functions of an OS:

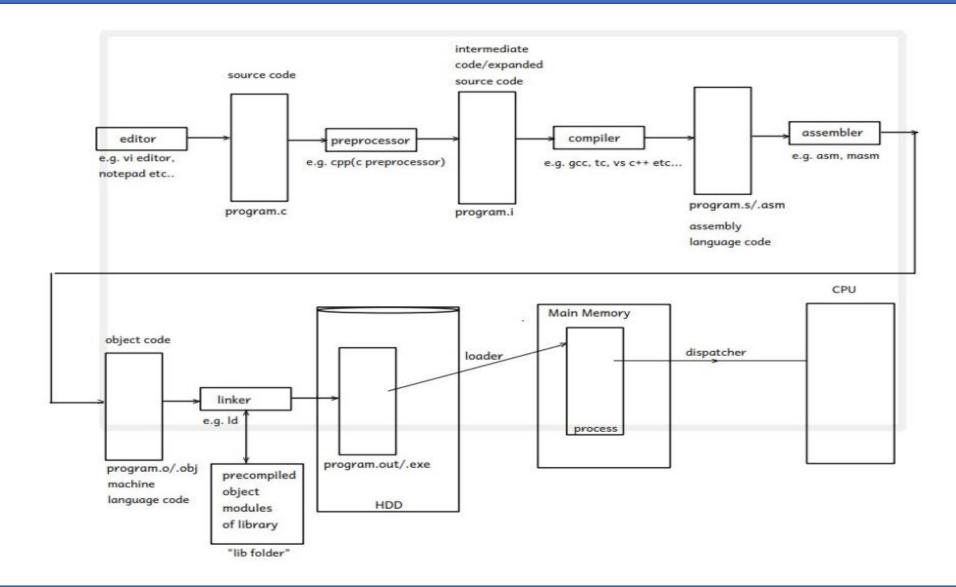

Basic minimal functionalities/Kernel functionalities:

- 1. Process Management
- 2. Memory Management
- 3. Hardware Abstraction
- 4. CPU Scheduling
- 5. File & IO Management

Extra utility functionalities/optional:

- 6. Protection & Security
- 7. User Interfacing
- 8. Networking

➤What is an IDE (Integrated Software Development)?

- It is an application software i.e. collection of tools/application programs like source code editor, pre-processor, compiler, linker, debugger etc... required for faster software development.
- e.g. VS code editor, MS Visual Studio, Net beans, Android Studio, Turbo C etc....
- 1. "Editor": it is an application program used to write a source code.
 - Source Code Program written in any programming language.
 - e.g. notepad, vi editor, gedit etc...
- 2. "Pre-processor": it is an application program gets executes before compilation and does two jobs
 - it executes all pre-processor directives and removes all comments from the source code.
 - e.g. cpp
- 3. "Compiler": it is an application program which converts high level programming language code into low level programming language code i.e. human understandable language code into the machine understandable language code.
 - e.g. gcc, tc, visual c etc...

4. "Assembler": it is an application program which converts assembly language code into machine language code/object code.

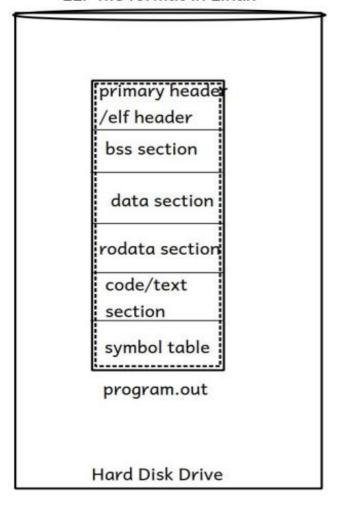

e.g. masm, tasm etc...

5. "Linker": it is an application program which links object file/s in a program with precompiled object modules of library functions exists in a lib folder and creates final single executable file.

e.g. ld: link editor in Linux.

Structure of an executable file ELF file format in Linux

- primary header/exe header: it contains information which is required to starts an
 execution of the program.
- e.g. addr of an entry point function --> main() function
- magic number: it is constant number generated by the compiler which is file format specific.
 - magic number in Linux starts with ELF in its eq hexadecimal format.
 - info about remaining sections.
- 2. bss(block started by symbol) section: it contains uninitialized global & static vars
- 3. data section: it contains initialized global & static vars
- 4. rodata (readonly data) section: it contains string literals and constants.
- 5. code/text section: it contains an executable instructions
- 6. symbol table: it contains info about functions and its vars in a tabular format.

≻Booting Process

- Terminologies :
- Bootstrap Program
 - It loads OS kernel into main memory
 - Each OS has Its own Bootstrap program.
 - Located in first sector of bootable storage device.

Bootable Device

- Storage device whose first sector (512 bytes) contains a special program "Bootstap Program".
- Usually it is device that stores OS installation setup;
- E.g. Bootable CD/DVD ,Bootable Pendrive.

Bootloader

- When multiple OS are installed on single computer, at the beginning one program asks end user about which OS boot.
- This task perform by bootloader program.
- Bootloader program bootstrap program of selected OS.
- Located in second sector of bootable storage device.

• BIOS/Firmwaer

- Firmware is a program/set of a program loaded into base ROM of motherboard.
- It is developed by Manufacturer of motherboard.
- The firmware developed for PC (by IBM) is named as BIOS: Basic Input Output System
- BIOS Contain
 - POST/BIST
 - Bootstrap loader
 - Information utility
 - Bootable Device preference/settings
 - Basic/Minimal device driver.

• POST/BIST

- **POST** Power ON Self Test
- **BIST** Built In Self Test
- Send signal to all peripheral(e.g. keyboard, mouse, monitor...) and test if they are functioning well.
- Located in Base ROM(Part of Firmware)

Bootstrap Loader :

- Finds the bootable device in the computer and start it's Bootloader.
- It check all devices in a order given in BIOS and start the first found bootable device.
- Located in Base ROM (Part of Firmware).

Booting:

- There are two steps of booting:

1. Machine Boot:

Step-1: when we switched on the power supply current gets passed to the motherboard on which from ROM memory one micro-program gets executes first called as **BIOS(Basic Input Output System)**.

Step-2: first step of BIOS is **POST(Power On Self Test),** under POST it checks wheather all peripheral devices are connected properly or not and their working status.

Step-3: After POST it invokes **Bootstrap Loader** programs, which searches for available **bootable devices** presents in the system, and it selects only one bootable device at a time as per the priority decided in BIOS settings.

2. System Boot:

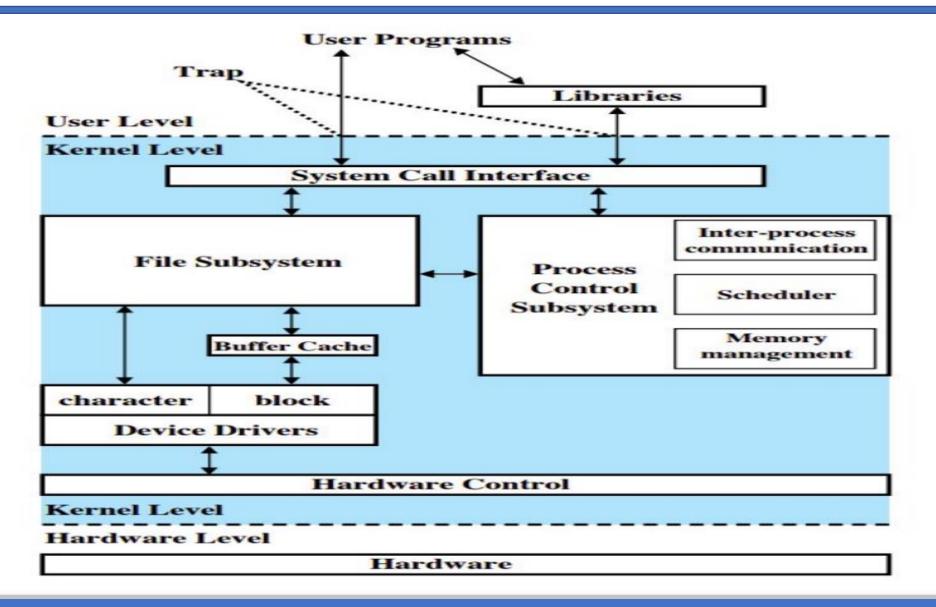

Step-4: After selection of a bootable device (budefault HDD), **Bootloader Program** in it gets invokes which displays list of names operating systems installed on the disk, from which user need to select any one OS.

Step-5: Upon selection of an OS, Bootstrap Program of that OS gets invokes, which locates the kernel and load into the main memory

- **OUNIX Operating System:**
- o UNIX : UNICS Uniplexed Information & Computing Services/System.
- UNIX was developed at AT&T Bell Labs in US, in the decade of 1970's by Ken Thompson, Denies Ritchie and team.
- o It was first run on a machine **DEC-PDP-7** (Digital Equipment Corporation Programmable Data Processing-7).
- **OUNIX** is the first multi-user, multi-programming & multi-tasking operating system.
- UNIX was specially designed for developers by developers
- System architecture design of UNIX is followed by all modern OS's like Windows, Linux, MAC OS X, Android etc..., and hence UNIX is referred as mother of all modern operating systems.

- o Kernel acts as an interface between programs and hardware.
- Operating System has subsystems like System Call Interface Block, File Subsystem Block, Process Control Subsystem Block (which contains IPC, Memory Management & CPU Scheduling), Device Driver, Hardware Control/Hardware Abstraction Layer.
- **O There are two major subsystems:**
 - 1. Process Control Subsystem
 - 2. File Subsystem
- o In UNIX, whatever is that can be stored is considered as a file and whatever is active is referred as a process.
- File has space & Process has life.

- o From UNIX point of view all devices are considered as a file
- o In UNIX, devices are categorizes into two categories:
 - 1. Character Devices: Devices from which data gets transferred character by character
 - → character special device file
 - e.g. keyboard, mouse, printer, monitor etc...
 - 2. Block Devices: Devices from which data gets transferred block by block
 - → block special device file
 - e.g. all storage devices.
- o **Device Driver**: It is a program/set of programs enable one or more hardware devices to communicate with the computer's operating system.
- Hardware Control Layer/Block does communication with control logic block i.e. controller of a hardware.

➤ Dual Mode Operation:

System runs in two modes:

- 1. System Mode
- 2. User Mode

1. System Mode:

- o When the CPU executes system defined code instructions, system runs in a system mode.
- o System mode is also referred as kernel mode/monitor mode/supervisor mode / privileged mode.

2. User Mode:

- o When the CPU executes user defined code instructions, system runs in a user mode.
- o User mode is also referred as non privileged mode.
- o Throughout execution, the CPU keeps switch between kernel mode and user mode

Dual Mode Operation:

- Throughout an execution of any program, the CPU keeps switches in between **kernel mode and user mode** and hence system runs in two modes, it is referred as dual mode operation.
- oTo differentiate between user mode and kernel mode one bit is there onto the CPU which is maintained by an OS, called as mode bit, by which the CPU identifies weather currently executing instruction is of either system defined code instruction/s or user defined code instruction/s.
- \circ In Kernel mode value of mode bit = 0, whereas
- \circ In User mode value of mode bit = 1.

Operating Systems and Computer Fundamentals

1. CUI/CLI: Command User Interface/Command Line Interface

- By using this kind of interface user can interacts with an OS by means entering commands onto the terminal/command line in a text format.
- e.g. In Windows name of the program which provide CUI => cmd.exe
- command prompt In Linux name of an application program which provides CUI => shell/terminal
- In MSDOS name of the program which provides CUI => command.com (Microsoft Disk Operating System).

2. GUI: Graphical User Interface

- by using this kind of interface user can interacts with an OS by means making an events like click on buttons, left click/right click/double click, menu bar, menu list etc.....
- - Windows = User friendly GUI.
- e.g. In Windows name of an application program which provides GUI => explorer.exe
- In Linux name of an application program which provides GUI => GNOME/KDE (GNU Network Object Model Environment / Common Desktop Environment).

Thank you!
